HydroShare: A Platform for Collaborative Data and Model Sharing in Hydrology

Access these slides in HydroShare by searching for "GeoDaRRS"

David Tarboton, Ray Idaszak, Jeffery S Horsburgh, Daniel P Ames, Jonathan L Goodall, Alva Couch, Richard Hooper, Shaowen Wang, Martyn Clark, Pabitra Dash, Hong Yi, Christina Bandaragoda, Anthony Castronova, Tian Gan, Zhiyu Li, Mohamed Morsy, Maurier Ramirez, Jeffrey Sadler, Dandong Yin, Yan Liu.

HydroShare is operated by CUAHSI with ongoing development through a collaborative project among Utah State University, Brigham Young University, CyberGIS Center University of Illinois, Tufts, University of Virginia, and RENCI University of North Carolina.

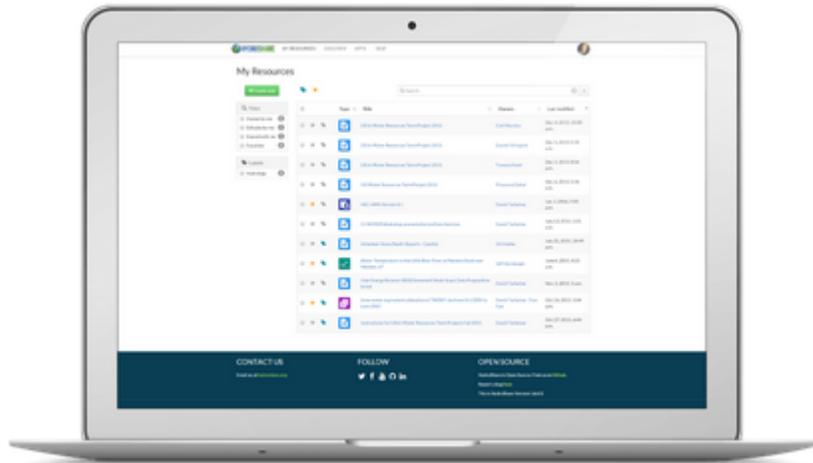

<http://www.hydroshare.org>

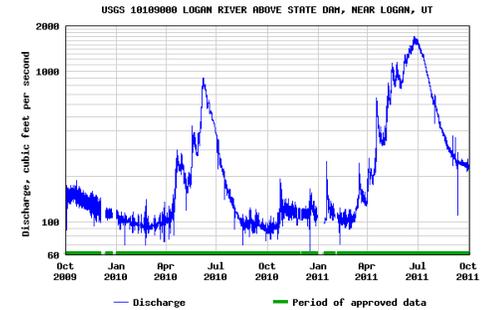

Motivation: Collaborative research

Advancing Hydrologic Understanding

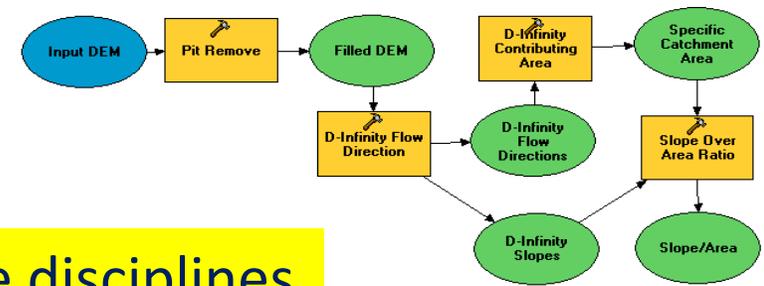

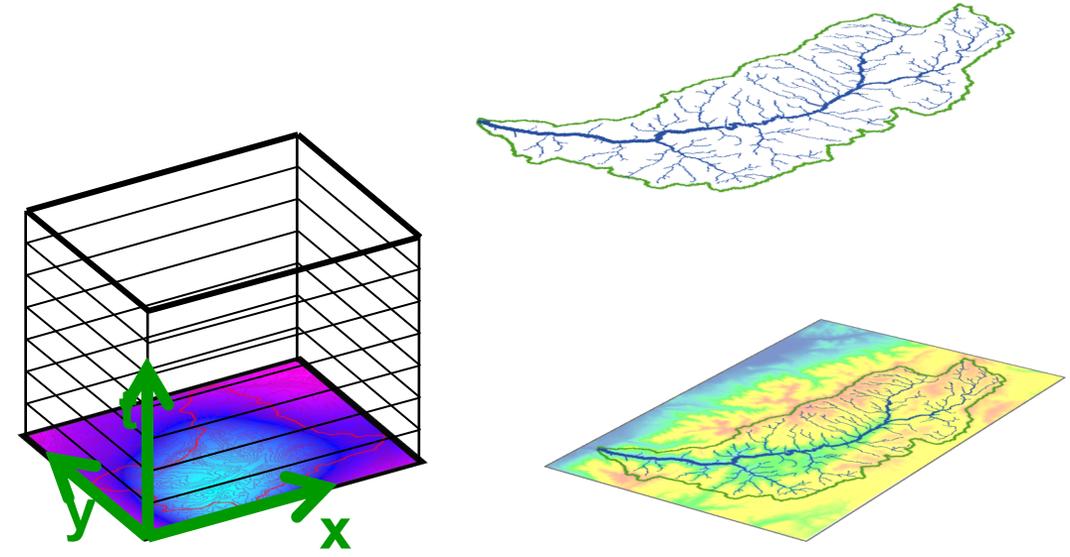

- requires integration of information from multiple sources
- using diverse types of data and models
- may be data and computationally intensive
- requires collaboration and working as a team/community

This applies for many Geoscience disciplines

Resources
Data and models
Social Objects

“All of the primary datasets collected as part of this project will be made freely and publicly available...”

- iUTAH Proposal Data Management Plan

Many of us put statements like this in our Data Management Plan, but how do we really accomplish this?

Ideal Investigator Data Workflow

- Easily create a digital instance of a dataset or model
- Quickly share it with colleagues (perhaps privately at first)
- Add value through collaboration, annotation, and iteration
- Describe with metadata
- Eventually...share publicly or formally Publish

This is still not as easy as it should be!

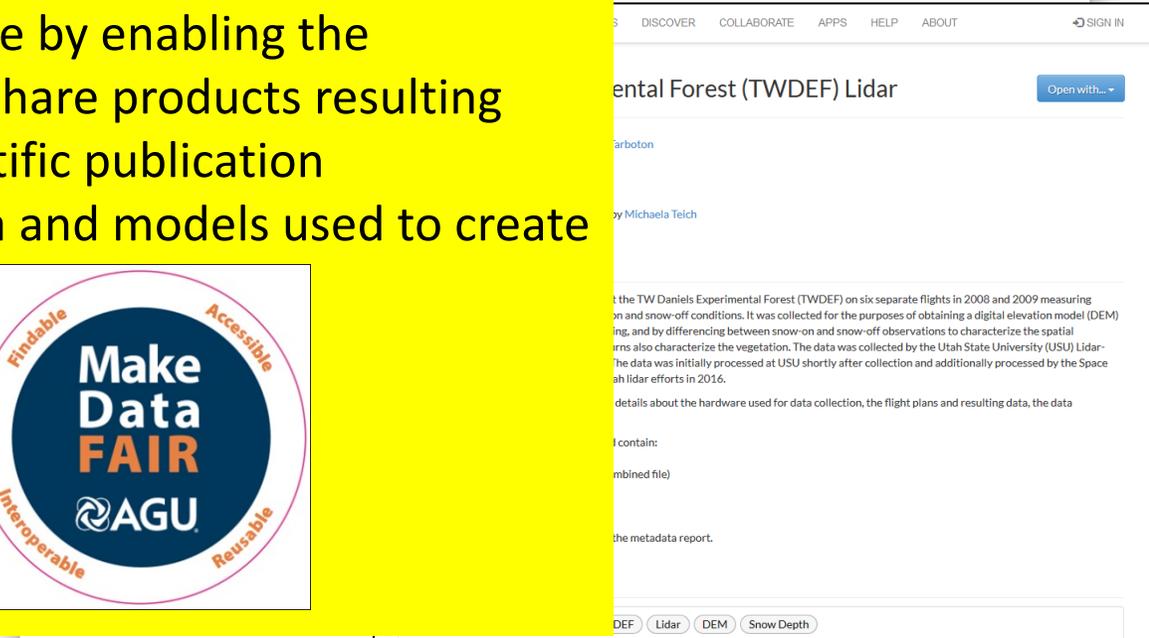

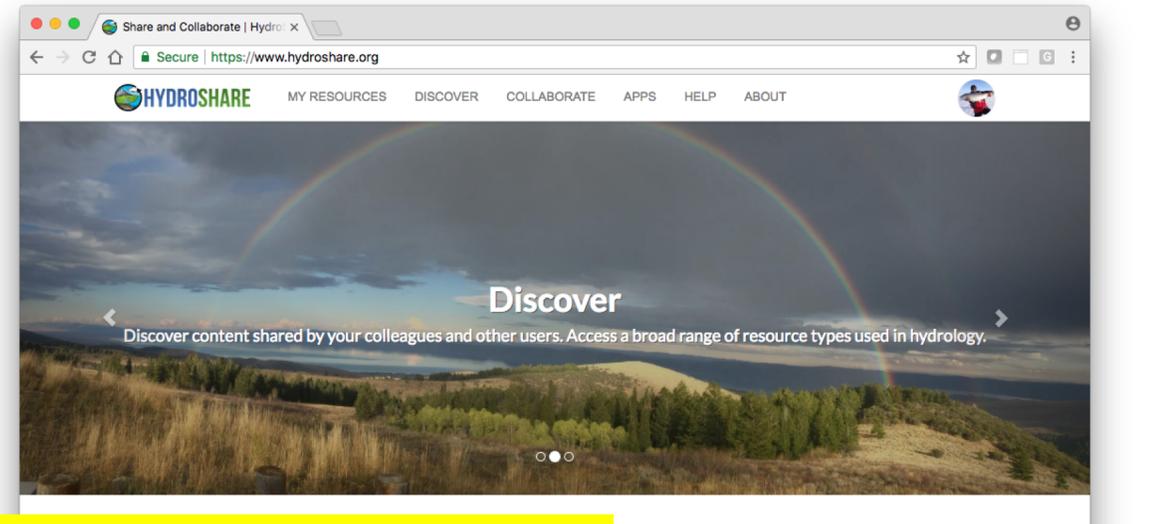

HYDROSHARE

<http://www.hydroshare.org>

- Web-based Hydrologic Information System operated by the Consortium of Universities for the Advancement of Hydrologic Science, Inc. (CUAHSI)
- Gives you a way to share your research products
- Has capabilities for collaboration
- Has Links to computational tools
- Provides permanent and citable digital objects

A system to advance hydrologic science by enabling the community to more easily and freely share products resulting from their research, not just the scientific publication summarizing a study, but also the data and models used to create the scientific publication.

- Findable
- Accessible
- Interoperable
- Reusable

- ✓ Share, access, visualize and manipulate models
- ✓ Use the web services API to program a plan
- ✓ Publish data and models to meet the requirements
- ✓ Discover and access data and models

Abstract

This resource contains lidar data, collected at the TW Daniels Experimental Forest (TWDEF) on six separate flights in 2008 and 2009 measuring surface and canopy properties during snow-on and snow-off conditions. It was collected for the purposes of obtaining a digital elevation model (DEM) to characterize the area for snowmelt modeling, and by differencing between snow-on and snow-off observations to characterize the spatial distribution of snow depth. Canopy lidar returns also characterize the vegetation. The data was collected by the Utah State University (USU) Lidar-Assisted Stereo Imaging (LASSI) laboratory. The data was initially processed at USU shortly after collection and additionally processed by the Space Dynamics Laboratory (SDL) in support of iUtah lidar efforts in 2016.

The metadata report (sdl16-1363-.pdf) gives details about the hardware used for data collection, the flight plans and resulting data, the data processing steps, and a brief error analysis.

Zip files are named by the collection date and contain:

- Terra Scan Binary Files
- LAS Files (one for each flight line and the combined file)
- KML Files (one for each flight line)
- ASC DEM file (1 m resolution)
- PNG Hillshade file

A complete list can be found on pp. 17-22 of the metadata report.

Resource Organization Concepts

- A **composite resource** can hold multiple aggregations
 - Each being a different type of data
 - Managed as one discoverable resource
 - One set of access controls (Owners, Editors etc.)
 - One unique identifier
 - One set of resource level metadata
- A **collection** can hold multiple resources
 - Each has own unique identifier
 - Own access control (separate owners and editors etc.)
 - Separate resource level metadata and landing page
- Collections and their members may each be discovered separately
- Composite resources may be members of Collections
- Unique keyword tags form informal collections (e.g. “geodarrs”)

But there is more ...

ABOUT

HydroShare Apps Library

HydroShare apps allow you to visualize, analyze, and work with resources (data and models) in HydroShare. Apps are hosted on separate web servers from the HydroShare website (www.hydroshare.org) and access HydroShare resources using web services via the REST applications programmers interface (API). Anyone can write an app and then create a "Web App" resource that holds the configuration information for launching the App from HydroShare. This page lists CUAHSI approved web apps that are supported as part of HydroShare.

The icon for HydroShare GIS features a blue square background with a white circle in the center. Inside the circle, there is a white stylized 'A' shape that resembles a mountain range or a water flow diagram. A small white circle with a lowercase 'i' is in the top-left corner.

HydroShare GIS

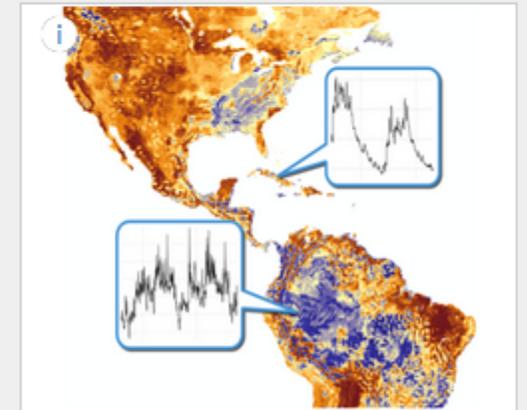

The icon for JupyterHub features a white square background with an orange crescent shape in the center. The word "jupyter" is written in a lowercase, sans-serif font across the middle. There are three small grey circles: one at the top-left, one at the top-right, and one at the bottom-left. A small white circle with a lowercase 'i' is in the top-left corner.

JupyterHub

The icon for National Water Model Forecasts features a circular logo with a blue sky, a yellow sun, and red mountains. Below the logo, the text "NWM" is in large blue letters, and "Forecasts" is in red. There are two green leaf-like shapes at the bottom. A small white circle with a lowercase 'i' is in the top-left corner.

National Water Model F...

The icon for Data Rods Explorer App features a map of North and South America with a color gradient from blue to orange. Two callout boxes with line graphs are overlaid on the map. A small white circle with a lowercase 'i' is in the top-left corner.

What I would like and why?

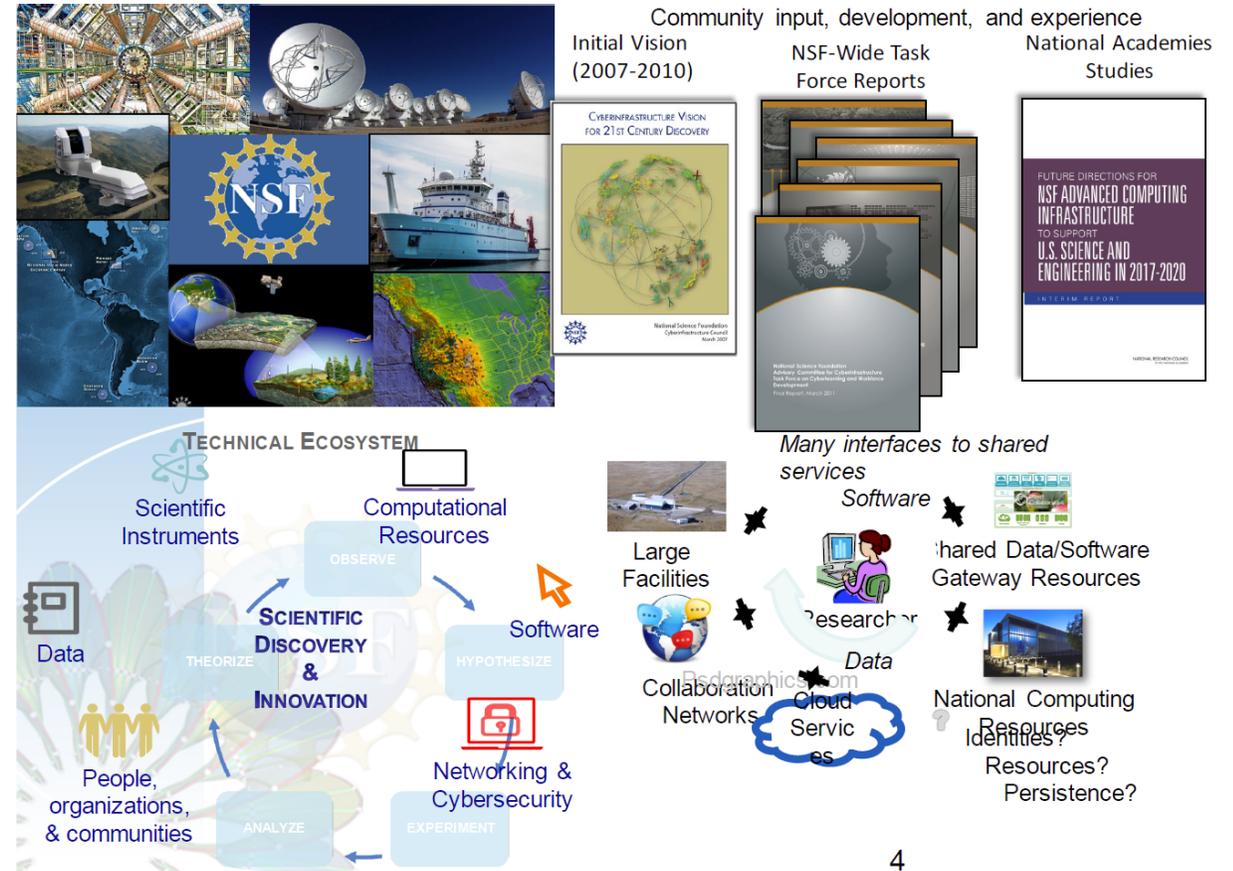

A platform for collaboration and computation that integrates data storage, organization, discovery, and programmable actions through web applications (web apps) and that allows researchers to easily employ services beyond the desktop to make data storage and manipulation more reliable and scalable, while improving ability to collaborate and reproduce results.

A complete web (cloud/server) based innovation environment

- Ability to work with large datasets
- Ability to hold data public and private
- Integrated data and compute
- Support for the complete data life-cycle
- Easy to use tools and coding environment
- Compatibility and platform independence

Interoperability

- A foundation of the web
- No one system can do it all
- Applications programming interfaces (APIs)
- Unique Identifiers that enable linked data (web URI's)
- A cyberinfrastructure ecosystem of many interfaces to shared services

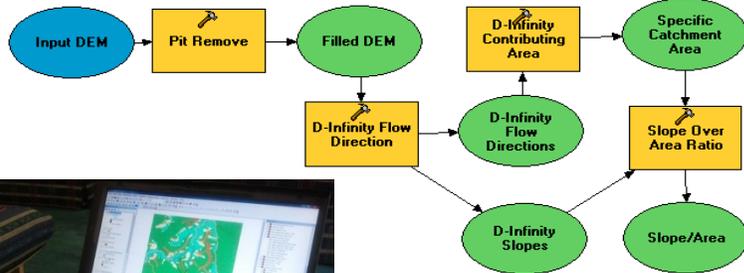

NSF vision for a cyberinfrastructure of many interfaces to shared services [Rajiv Ramnath, NSF Division of Advanced Cyberinfrastructure

<https://doi.org/10.6084/m9.figshare.4676173>]

-bash-3.2$
```

Enable, for non-HPC specialists, the capability to use HPC Resources

Data Management

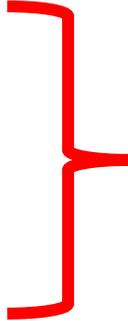

- Not a separate topic (last part of proposal)
- Is actually about doing good science
- Knowing what the data means (metadata)
- Knowing suitability for purpose (metadata)
- Needs to be integrated into research workflows

Summary

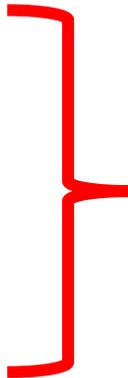

HydroShare is a web based collaboration environment to enable more rapid advances in hydrologic understanding through collaborative data sharing, analysis and modeling

- Sharing and publication of data (DOI)
- Social discovery and added value
- Model sharing

- Model input data preparation
- Model execution
- Visualization and analysis (best of practice tools)

Collaboration, Reproducibility,
Credit, Transparency

Server/Cloud Computation

- Platform independence
- Big data
- Reproducibility
- Reduce needs for software installation and configuration

CUAHSI 2017 Hurricane Data Community

To share data from Hurricanes Harvey, Irma and Maria that impacted the US and Caribbean region in 2017.

Following Hurricanes Harvey, Irma and Maria that had significant impacts to parts of the US and islands in the Caribbean there has been much activity to assemble, document and archive data from these events. This data is intended to support research to improve our understanding of and capability to prepare for and respond to such extreme events in the future. This group has been created as a community within HydroShare for users interested in these data archives. This is open for anyone to join. Anyone who joins can share data (HydroShare resources) with this group. Sharing resources with this group makes them
